

SMRs

Small But Mighty Reactors!

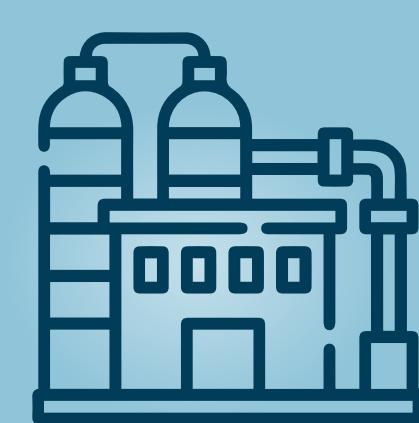

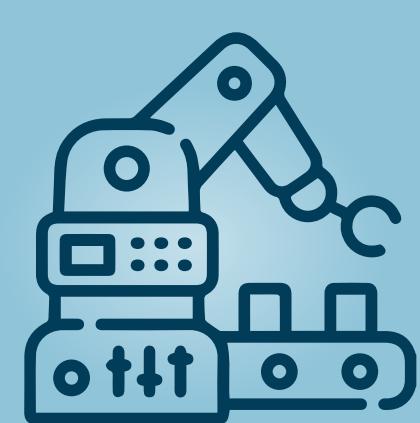

Small

In Power < 300 MWe.

In Contracted Site and Grid.

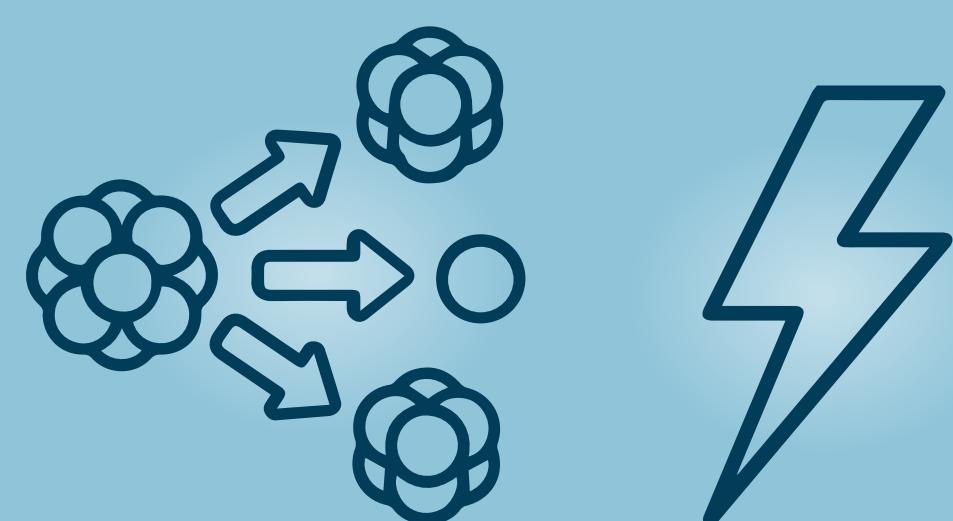

Modular

Fabricated Standardized Transported Assembled

Reactor

Fission to Electricity!

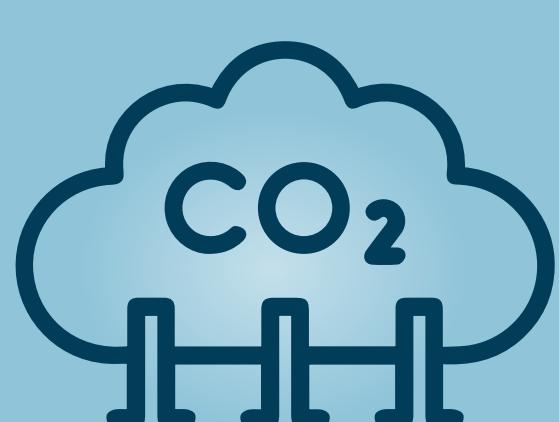

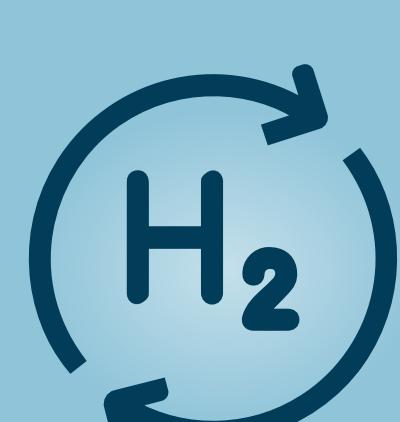

Future Role

Beyond electricity generation,

SMRs are expected to support

hydrogen production, district heating,
desalination, and industrial process heat.

As regulatory frameworks mature and supply
chains develop, SMRs are positioned to become
a key component of low-carbon energy
systems, particularly for regions
seeking reliable, scalable, and
resilient power solutions.

“Redefining nuclear energy with compact design, modular construction, and enhanced safety margins.”

Design

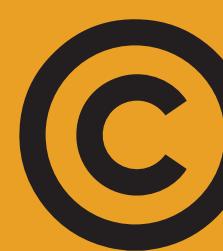

SMRs are advanced nuclear reactors designed around modularity and simplification. By integrating the reactor core, coolant system, and safety features into a compact layout, SMRs reduce complexity and construction uncertainty.

Multiple reactor modules can be deployed at a single site, allowing capacity to grow with demand.

Near-term Developments

- Transition from prototypes to commercial deployment.
- Standardization of designs and licensing processes.
- Cost reduction through serial manufacturing.

Created and Designed By: Abdu El-Rahman Barakat - Alaa Ashraf - Al-Shima Ebrahim - Ereny Josief - Eslam Zakaria - Hania Ahmed - Lamia Hani - Yomna Ahmed, February 2026.

Department: Nuclear and Radiation Engineering Department, Alexandria University.

Supervisor: Prof. Dr. Alya Badawi.
